

## July 2009: The EOLTEC's SCIROCCO wind turbine generates highest annual energy in a British study

The Energy Saving Trust, has just published the results of their 2 years study made on 57 installations of low-power wind turbines in the UK. The report concludes that the Best performing site is corresponding to the EOLTEC's Scirocco 6 KW wind turbine located in the Orkney Islands. The report takes into account the availability of the installation and the annual energy generation. In the Scirocco's case, the annual energy generation has reached 22000 KW.h. According to the report and thanks to the very high energy generation, the pay back of the installation is reached in less than 10 years. Let's remind that the Scirocco wind turbines are equipped with the ALXION 400STK3M frameless alternators operating in direct driving.
