

November 2009: NOVEOL introduces its Nov'éolienne Family wind turbine.

The company NOVEOL (www.noveol.com) established close to Poitiers Futuroscope, France, recently introduced its new wind turbine called Nov'éolienne Family. It is a compact Vertical Axis Wind Turbine with 2 KW rated power dedicated to urban environment. The helical shape of the blades allows to fit correctly to sites with variable direction winds. NOVEOL thus aims at the energetic autonomy of a mean family without taking into account heating. The compactness and silent operation are key-figures of merit in the purpose of urban development. The wind turbine is equipped with an ALXION 145STK6M frameless alternator in direct driving without gear. A new model called *Collective* with a 6 KW rated power will be introduced later.
